

Deploy

Prerequisites:

- JDK
- sbt
- SSH/SCP

Deployment:

1. Go to project root (coolecnik directory under Git root)
2. Execute 'sbt dist'
3. Go to target/universal
4. Secure copy the zip archive to coolecnik@coolecnik.felk.cvut.cz: (PWD: app103c00lecn1k)
5. SSH to coolecnik@coolecnik.felk.cvut.cz
6. Execute 'app/stop' and make sure that the application is not running (script's output that the app has been stopped or is not running should be enough)
7. Execute 'app/start PATH_TO_ARCHIVE' and make sure that deployment script has succeeded
8. Go to coolecnik.felk.cvut.cz and make sure that application is running

Troubleshooting:

If there was any problem during deploy (including password prompt), do the following:

- * Run app/stop and make sure that app is not running (top/htop/ps should not have any processes with 'play' in the name), delete the RUNNING_PID file from the ~/app/coolecnik directory, delete the ~/app/backup/ARCHIVE_THAT_WAS_DEPLOYED and redeploy the archive
- * Make sure that archive has been copied entirely
